

LIBERTY RESCUE TUBE

Over the past 40 years more than 600 individuals have been engulfed and suffocated in flowing grain. These incidents have occurred in grain storage structures, grain storage piles, and grain transport vehicles. Based upon research conducted at Purdue University, approximately 80 percent of the cases documented that involved a partially entrapped victim, resulted in a fatality.

To assist emergency first responders in extricating victims entrapped in grain and enhance the likelihood of survival, Liberty Rescue Systems has developed and tested the Liberty Rescue Tube package. The package includes an innovative approach to providing protection to a partially entrapped victim to assist in recovery and rescue strategies based upon research into what has worked in prior rescue. Training in the use of the tube is also available.
